

Laser Hair FAQ's

Q: I've had IPL before, how will the laser treatment differ?

A: If you've had IPL before your hair reduction will have been a slow process. The LightSheer Diode laser is the gold standard for hair removal world-wide – you will notice about 1/3 total loss of hair with your first treatment. In general, you will require far less treatments and you will be hair free much sooner!

Q: Can I do a full Brazilian?

A: Absolutely. Laser is simply light, so it is harmless to your skin, including the delicate tissue around the vagina and anus. However it works very effectively and quickly on this dark coarse hair. Say a big "goodbye" to six weekly waxing forever!

Q: Is it painful to have a Brazilian laser treatment?

A: This area can get painful as the hair is so coarse and dark it absorbs loads of the laser light. This also means it works very quickly in this area and you need only 3 to 6 treatments in most cases. We will give you a topical local anaesthetic cream to apply before your treatment. This cream works quickly and will ensure the treatment is relatively comfortable.
