

Male Laser Hair Removal

Q: I've heard that laser hair removal is very painful and takes about an hour for each treatment. Is this true?

A: The Lightsheer Duet Laser that we use at Vie Institute is the latest technology. The head of this laser is 9 times larger than other lasers which means the treatment is 9 times faster! This larger head uses suction technology to improve the efficacy of the treatment. This suction tricks the skins pain receptors, so they feel the suction and not the heat. Your treatment will be quick and pain free!!

Q: I want my back and chest treated, but I've heard that this is very expensive. Is this true?

A: The larger head on our Lightsheer Duet hair removal laser means that treatments are quicker, and therefore less expensive. As this laser works far more efficiently than any other hair removal available, you will require fewer treatments to become hair free, which in turn means less cost.

Q: Can I have laser hair removal in my genital area?

A: Yes, the laser is harmless to the skin, including the delicate skin of the genitals and anal area. These areas require fewer treatments than other areas of the body as the hair is much coarser and darker and so absorbs more energy from the laser with each treatment, resulting in a quick clearing of the hair.
